Bug Report

Title: Authentication bypasses case sensitivity validation for the "Username" field during login.

BUG ID: BUG-001

DATE: 19/04/2026

Bug Type: Functional Bug / Security

Severity: HIGH (Classified as High because the system fails to validate the exact integrity of the authentication credentials. Although the user provides the correct username, the system stills allows access with data that does not strictly match the original database record, representing a vulnerability in the security layer.)

Priority: MEDIUM (Classified as Medium because, while it is a security flaw, the immediate business impact is controlled (the user still requires the correct password). Should be changed to High if the company's security policy strictly mandates case-sensitivity for all authentication fields.)

Test Environment:

- **Browser:** Google Chrome: Version 147.0.7727.56 (64 bits)
- **OS:** Windows 11 Home 25H2

Steps to reproduce:

1. Navigate to the OrangeHRM login page.
2. Enter the registered username using a different case than the original (e.g., enter “admin” or “ADMIN” instead of the correct “Admin”).
3. Enter the correct password (“admin123”).
4. Click the “Login” button.

Expected Behaviour: The system should strictly validate the username's case sensitivity. Since "admin" or "ADMIN" does not match the stored "Admin" exactly, the system should deny access and display the "Invalid credentials" error message.

Observed Behaviour: The system accepts the username regardless of the casing used (lowercase, uppercase, or mixed) and successfully redirects the user to the Dashboard page.

Evidence: Refer to TC07, TC09, and TC10 in the "Evidence Report" document, which show successful logins with "admin" and "ADMIN" usernames.

<u>Impact</u>: Although it doesn't break the system's core functionality, this behaviour weakens the authentication security layer. It makes the system more vulnerable to credential guessing or brute-force attacks by reducing the specific character combinations required for a successful login.

<u>Correction recommendation</u>: Implement a strict string comparison (case-sensitive) for the username field during the authentication process in the backend to ensure that only the exact registered credentials can grant access.

<u>Responsible QA</u>: Bruno Moreira
