Improvement Report

This improvement report outlines the usability and user experience (UX) improvements identified during the manual testing phase of the OrangeHRM login functionality. The goal of these proposals is to enhance system security and minimize authentication errors caused by common human mistakes.

Improvement #1: Password Visibility

Title: Implementation of a "Show Password" feature in the login field.

Priority/Severity: **Medium**

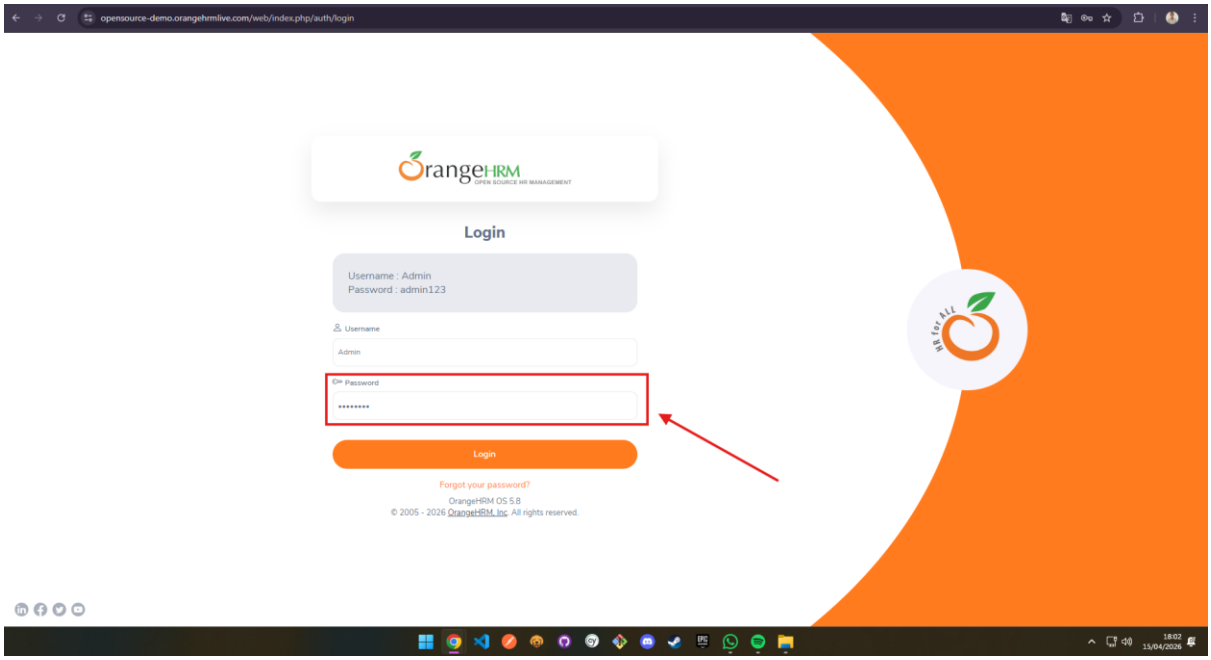
Steps to reproduce:

1. Navigate to the OrangeHRM login page.
2. Type the password in the “Password” field.
3. Observe that there is no option to reveal the characters being typed.

Expected Behaviour: The password field should include a toggle icon (e.g., an "eye" icon) that allows users to temporarily view the password to ensure accuracy.

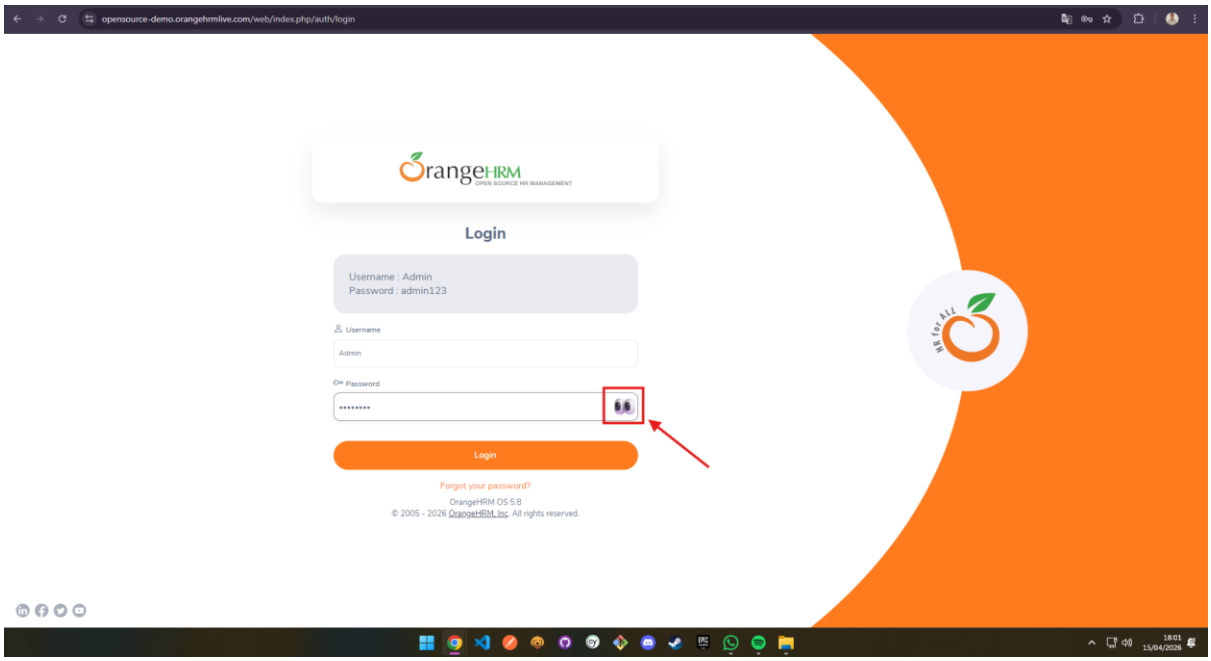
Observed Behaviour: The password always remains masked (hidden), with no option for the user to verify the input before submitting.

Evidence:



Impact: Users may frequently mistype their passwords, leading to multiple failed login attempts. This can result in account lockouts and a poor user experience, especially on mobile devices or for users with complex passwords.

Correction recommendation: Add a "Show/Hide" toggle button within the password input field.



Improvement #2: Automatic input trimming for Username field

Title: Lack of automatic white space removal (trimming) in the Username field. (View TC13 from the "Test Case Document" and from the "Evidence Report" documents)

Priority/Severity: **HIGH**

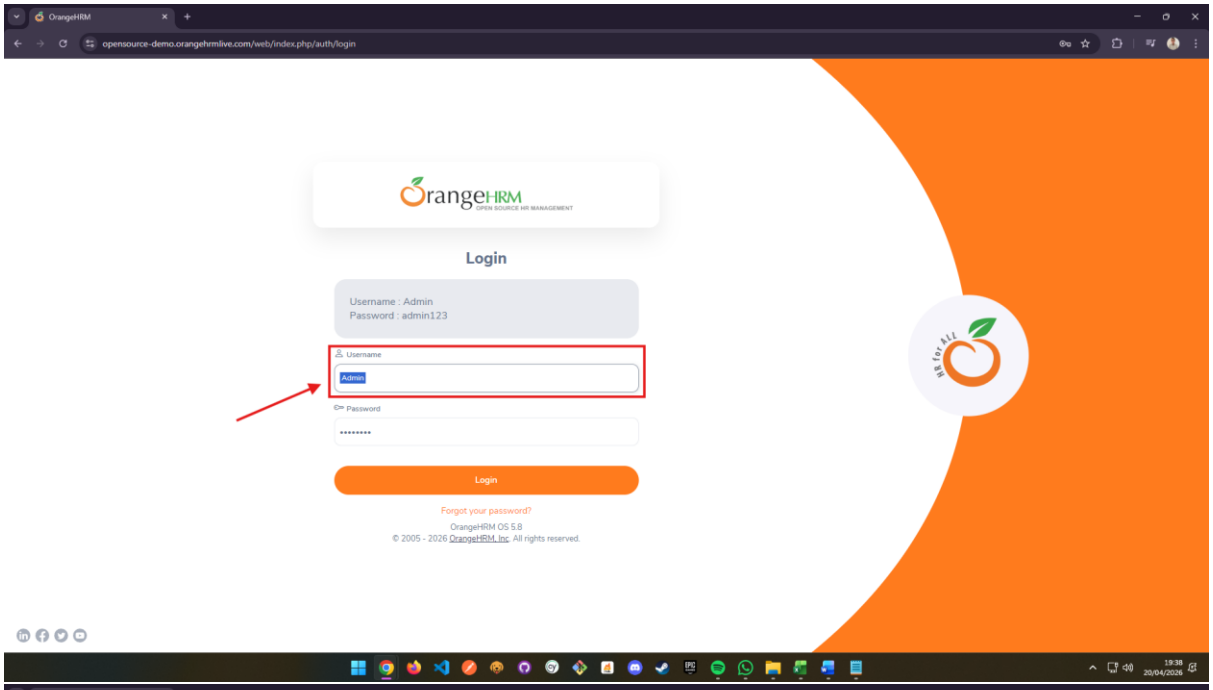
Steps to reproduce:

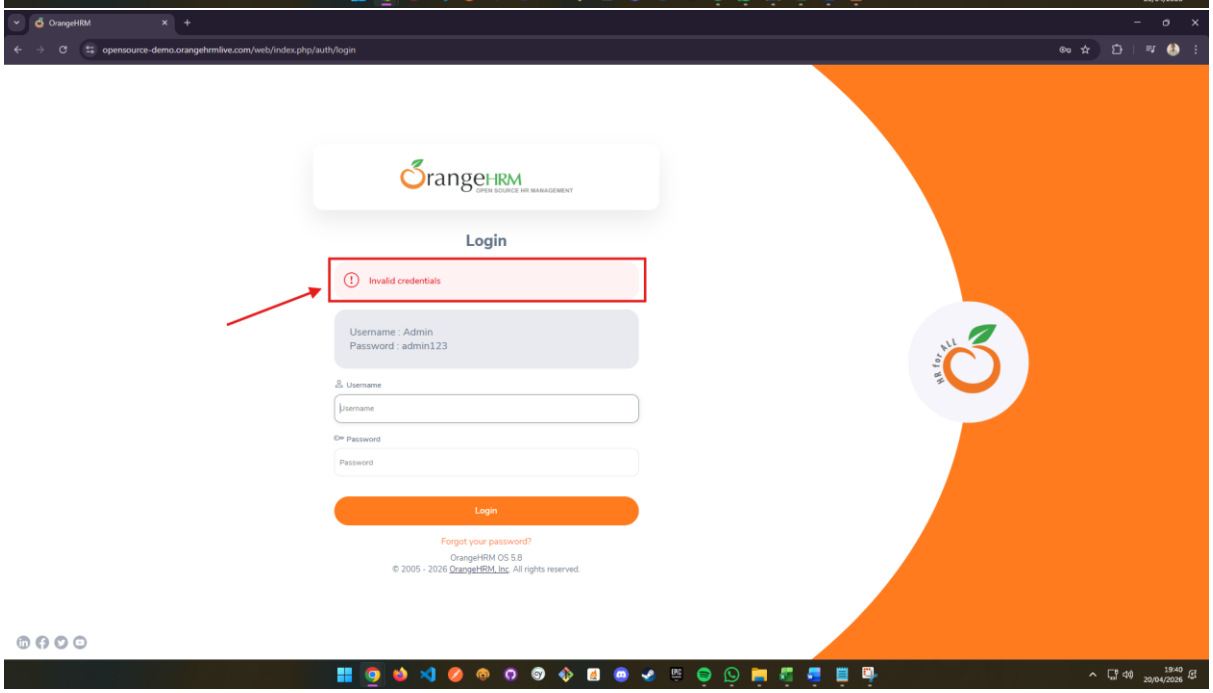
1. Navigate to the login page
2. Enter the username with an accidental space before or after the name (e.g., " Admin "
3. Enter the correct password
4. Click on the "Login" button

Expected Behaviour: The system should automatically trim (remove) leading and trailing white spaces from the username input before processing the authentication request.

Observed Behaviour: The system treats white spaces as literal characters, resulting in an **"Invalid credentials"** error even when the core username is correct.

Evidence:





<u>Impact</u>: High frustration for users who copy and paste their credentials from external sources (emails, documents), as invisible spaces often lead to **"Invalid credentials"** errors that are difficult for the user to diagnose.

Correction recommendation: Implement a .trim() function on the username input string, either on the front-end (JavaScript) or back-end, to ensure robust and user-friendly authentication.
